Demos Index                Sun Oct 12 04:08:27 PM EDT 2008

Demonstration Problem:
----------------------

    demos/count
        Count characters, words, and lines in text.
        Solutions are included with this demonstration
        problem.  The files available are:

        demos/count/Makefile     Commented Makefile.
        demos/count/README       Usage Info.
        demos/count/count.in     Judges input.
        demos/count/count.test   Judges output.
        demos/count/count.txt    Problem statement.
        demos/count/count1.c     Solution in C.
        demos/count/count1.cc    Solution in C++.
        demos/count/count1.java  Solution in JAVA.
        demos/count/count1.lsp   Solution in COMMONLISP.

Java IO Demo:
---- -- ----

    demos/javaio
        Demo of JAVA IO.  The files available are:

        demos/javaio/javaio.java Demo code.
        demos/javaio/Makefile    Makefile.
        demos/javaio/javaio.in   Test input.
        demos/javaio/javaio.test Test output.
```

```
Count Demo README           Fri Apr 14 10:28:05 EDT 2006

The files in this demo directory are:

    public/count/Makefile       Commented Makefile.
    public/count/README         Usage Info.
    public/count/count.in       Judges input.
    public/count/count.test     Judges output.
    public/count/count.txt      Problem description.
    public/count/count1.c       Solution in C.
    public/count/count1.cc      Solution in C++.
    public/count/count1.java    Solution in JAVA.
    public/count/count1.lsp     Solution in COMMONLISP.

There may be other files used exclusively by the judge,
such as .rc, .jin, and .jtest files.

The Makefile is commented, as opposed to most problem
Makefiles.  For a non-demo problem you are only given
the .txt file and the Makefile.

To run the demo (under UNIX), first

    cp count1.yy count.yy

for exactly ONE of yy = c, cc, java, or lsp.  Then

        make

To check that the output is correct

        diff count.out count.test

Then to submit the demo

        make submit

To see what debugging print commands might look like,
try
        make debug

If you want to edit the solution you chose, you may
first need to

        chmod u+w count.yy

(for the right yy), to make the file writable.

You should try introducing an error in the file and
resubmitting to see the response.  If you are in a
contest that permits 'in-submit' and 'inout-submit',
try

        make in-submit

and then

        make inout-submit

with a source file that has an error which makes it
produce incorrect output.

Read the Makefile for more information.

If you have a non-UNIX system, you can submit the file
count1.yy directly by sending email to the judge with
subject 'submit count.yy' (note there is no '1' here)
and body equal to the file count1.yy (here there is a
'1').  You may run count1.yy using your own system with
count.in as the standard input in order to generate
count.out.

Although in this directory the problem description is
in a .txt file, in other problem directories the problem
description may be in a .html, .htm, or .ps (postscript)
file.

# Makefile for the ‘count’ Demonstration Problem
#
# File:         Makefile
# Date:         Sat May  6 01:19:58 EDT 2006
#
# Exactly ONE of the four files count.c (C), count.cc
# (C++), count.java (Java), or count.lsp (Commonlisp)
# should exist.
#
# UNIX commands supported by this Makefile:
#
#       make            Same as ‘make count.out’.
#
#       make count      Makes the binary program file
#                       ‘count’ by running gcc on
#                       count.c, or g++ on count.cc,
#                       or javac on count.java,
#                       or hpcm_clisp on count.lsp,
#                       depending upon which of count.c,
#                       count.cc, count.java, or
#                       count.lsp exist.  Also makes a
#                       shell script named ‘count’ for
#                       count.java and count.lsp files.
#                       Does nothing if ‘count’ is more
#                       up to date than count.c,
#                       count.cc, count.java, or
#                       count.lsp.
#
#       make count.out  Makes ‘count’ as above and
#                       then runs it with no arguments
#                       and with the standard input
#                       coming from the file count.in.
#                       Puts the standard output in the
#                       file count.out, and then copies
#                       that to the screen.  Does noth-
#                       ing, however, if count.out is
#                       more recent than both count.in
#                       and count.
#
#       make count.debug  Ditto but runs ‘count debug’
#                       (with the one argument ‘debug’)
#                       instead of ‘count’ and puts the
#                       output in count.debug instead
#                       of count.out.
#
#       make debug      Same as ‘make count.debug’.
#
#       make submit     Makes ‘count.out’ just to be
#                       sure that nothing crashes, and
#                       then e-mails count.c, count.cc,
#                       count.java, or count.lsp to the
#                       judges.
#
#       make in-submit  Ditto, but requests that if
#                       the score is ‘Incorrect Output’
#                       or ‘Formatting Error’, the
#                       judge’s input for the failed
#                       test case will be returned in
#                       e-mail to the contestant.
#
#       make inout-submit
#                       Ditto but requests both the
#                       judge’s input and the judge’s
#                       output for the test case.
#
#       make solution-submit
#                       Like ‘make submit’ but requests
#                       that if the score is ‘Completely
#                       Correct’ the judge’s solution
#                       will be returned in e-mail to
#                       the contestant.
#
#       make clean      Removes ‘count’, count.out, and
#                       other intermediate files that
#                       might exist, such as ‘core’,
#                       ‘count.class’, or count.fas.

```

```
This is a good paragraph to start with.

And to continue in a bit more
complicated
vein,
this is a good paragraph.

But
 the
  ultimate
   in
    poetically
     possible
      paragraphs
       is
        this,
         or
          is
           it!

Oh Well.
```

```
Paragraph 1: 1 lines, 8 words, 39 characters.
Paragraph 2: 4 lines, 14 words, 70 characters.
Paragraph 3: 12 lines, 12 words, 124 characters.
Paragraph 4: 1 lines, 2 words, 8 characters.
```

Paragraph Character/Word/Line Counting.

The Itsy Bitsy Counting Company has a job counting the number of characters, words, and lines in a paragraph.

A paragraph is a sequence of 1 or more non-blank lines.

All the characters of a line count EXCEPT the trailing new line.

A word is a sequence of non-space (non ' ') characters on a line, and is separated from other words on the same line by sequences of space (' ') characters.

The only whitespace characters in the input are space and newline (' ' and '\n'). No line has more than 100 characters in it, not counting the new line at the end.

Paragraphs are separated by one or more blank lines. A blank line may have whitespace characters, but nothing else.

The paragraphs in the input are numbered 1, 2, ... The program reads its standard input, and for each paragraph in that input, prints the paragraph number and the counts, in exactly the following format:

Paragraph #: # lines, # words, # characters.

where each # denotes 1 or more decimal digits.

Example Input:
------- -----

```
This is a good paragraph to start with.

And to continue in a bit more
complicated
vein,
this is a good paragraph.

But
 the
  ultimate
   in
    poetically
     possible
      paragraphs
       is
        this,
         or
          is
           it!

Oh Well.
```

Example Output:
------- ------

```
Paragraph 1: 1 lines, 8 words, 39 characters.
Paragraph 2: 4 lines, 14 words, 70 characters.
Paragraph 3: 12 lines, 12 words, 124 characters.
Paragraph 4: 1 lines, 2 words, 8 characters.
```

```
#include <stdio.h>

#define dprintf if ( debug ) printf

```

```
This is a nice sentence.
And another.

These are some numbers:
   1 2 3 4 5 6 7 8 9 10
   8.4 123456789

These are some strange cases:
   . - a-b -a -3.0a

How about some separators, (a good thought).
Well, not everything that should be is a separator.
```

```
WORD This
WORD is
WORD a
WORD nice
WORD sentence.
WORD And
WORD another.
Paragraph 1:
    2 lines, 7 words, 0 numbers, 0 separators.
    100.00% words, 0.00% numbers, 0.00% separators.
WORD These
WORD are
WORD some
WORD numbers:
NUMBER 1.0 = 1.00
NUMBER 2.0 = 2.00
NUMBER 3.0 = 3.00
NUMBER 4.0 = 4.00
NUMBER 5.0 = 5.00
NUMBER 6.0 = 6.00
NUMBER 7.0 = 7.00
NUMBER 8.0 = 8.00
NUMBER 9.0 = 9.00
NUMBER 10.0 = 10.00
NUMBER 8.4 = 8.40
NUMBER 1.23456789E8 = 123456789.00
Paragraph 2:
    3 lines, 4 words, 12 numbers, 0 separators.
    25.00% words, 75.00% numbers, 0.00% separators.
WORD These
WORD are
WORD some
WORD strange
WORD cases:
NUMBER 0.0 = 0.00
SEPARATOR -
WORD a-b
SEPARATOR -
WORD a
NUMBER -3.0 = -3.00
WORD a
Paragraph 3:
    2 lines, 8 words, 2 numbers, 2 separators.
    66.67% words, 16.67% numbers, 16.67% separators.
WORD How
WORD about
WORD some
WORD separators
SEPARATOR ,
SEPARATOR (
WORD a
WORD good
WORD thought
SEPARATOR )
NUMBER 0.0 = 0.00
WORD Well
SEPARATOR ,
WORD not
WORD everything
WORD that
WORD should
WORD be
WORD is
WORD a
WORD separator.
Paragraph 4:
    2 lines, 16 words, 1 numbers, 4 separators.
    76.19% words, 4.76% numbers, 19.05% separators.
```
